

Instructions for installation of LED light bar

1. Carefully unwrap the LED light bar. Take care in handling so that the LED strips and connections to transformers are not disturbed.
2. Remove tie from the electrical cord.
3. Lay the LED light bar on top of the upper shroud with the LED strip facing down. It is designed to simply rest on the upper shroud.
4. On one end you will see a white wire with a dark red sensor at the tip hanging down. This is the infrared sensor that you should pull down and adjust so it is barely below the shroud as it has to have a 'line of sight' with the remote control pad (See instructions on using the LED lights).
5. Take the light cord with the plug and drape it over the back of the fountain and down to where you will plug it in so it is concealed behind the fountain.
6. You are now ready to use your LED light bar.

Note:

If you wish to totally hide the cord and plug, you will need to remove the fountain and have an electrician provide a recessed electrical outlet behind the fountain. Then while someone (two people for larger fountains) is holding the fountain, a third person should plug in the LED light to the recessed outlet, then hang the fountain back on the wall.
